What is arithmetic circuit structure?

Array multiplier for two's complement numbers.

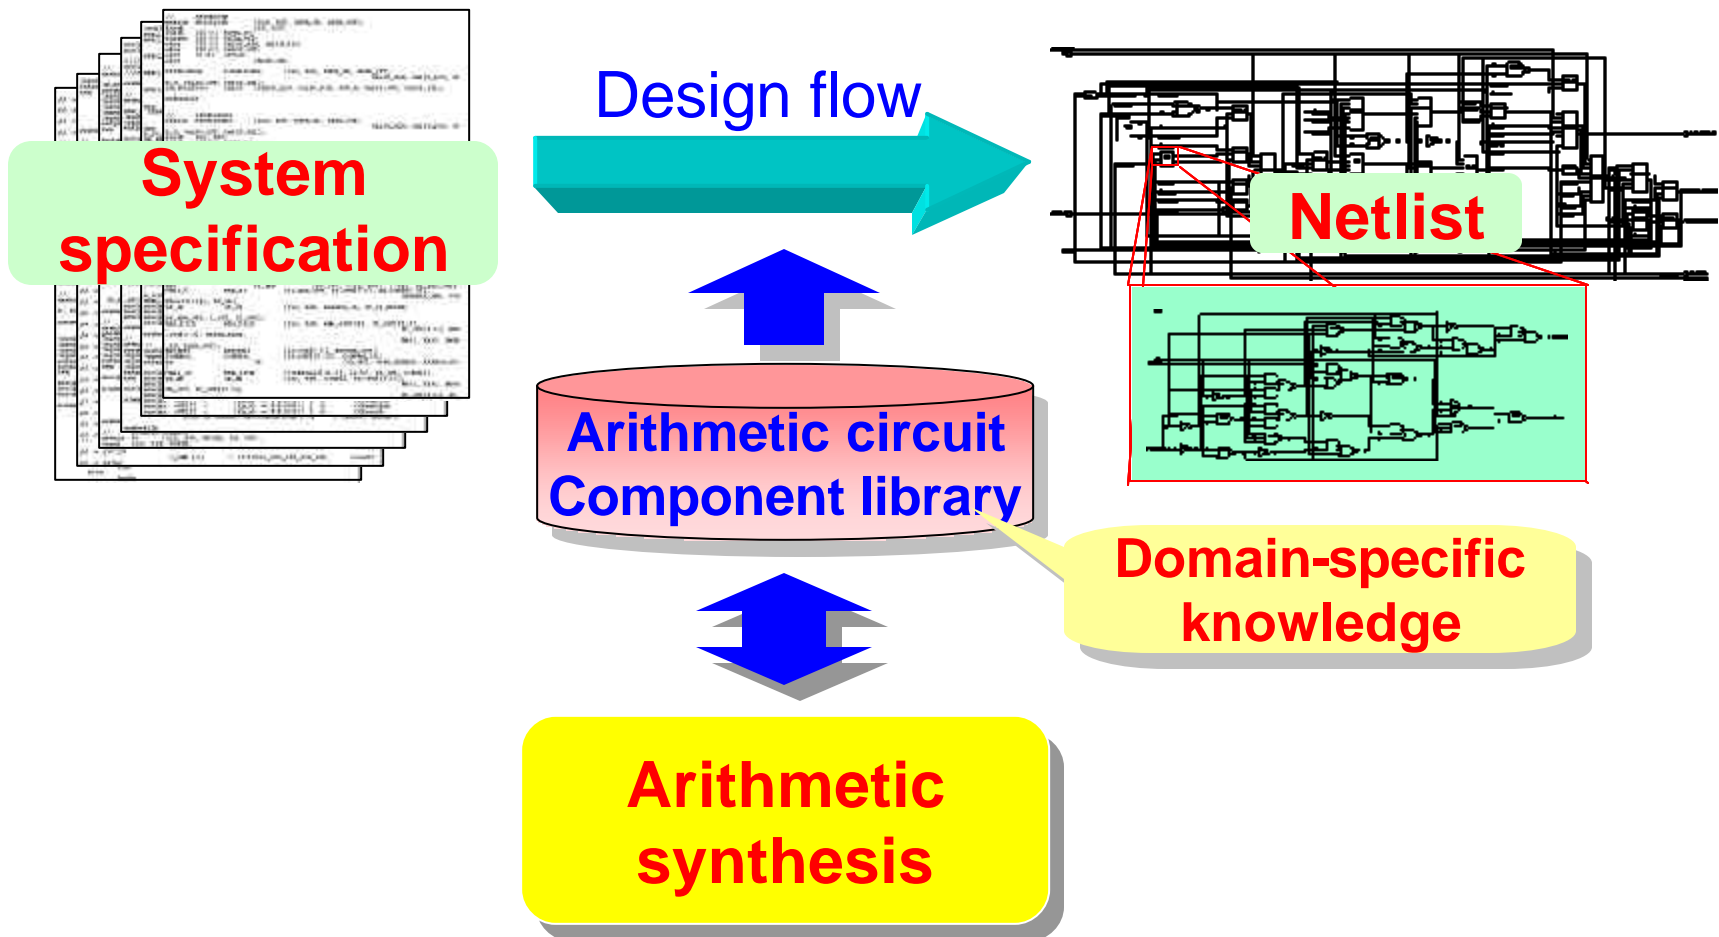

Booth's algorithm array multiplier.

Pipelined 5 × 5 array multiplier for unsigned numbers.

There is no systematic way of optimizing the circuit structure for a given function.

High-level synthesis flow

Is it possible to synthesize arithmetic circuits?

Graph-based evolutionary optimization technique

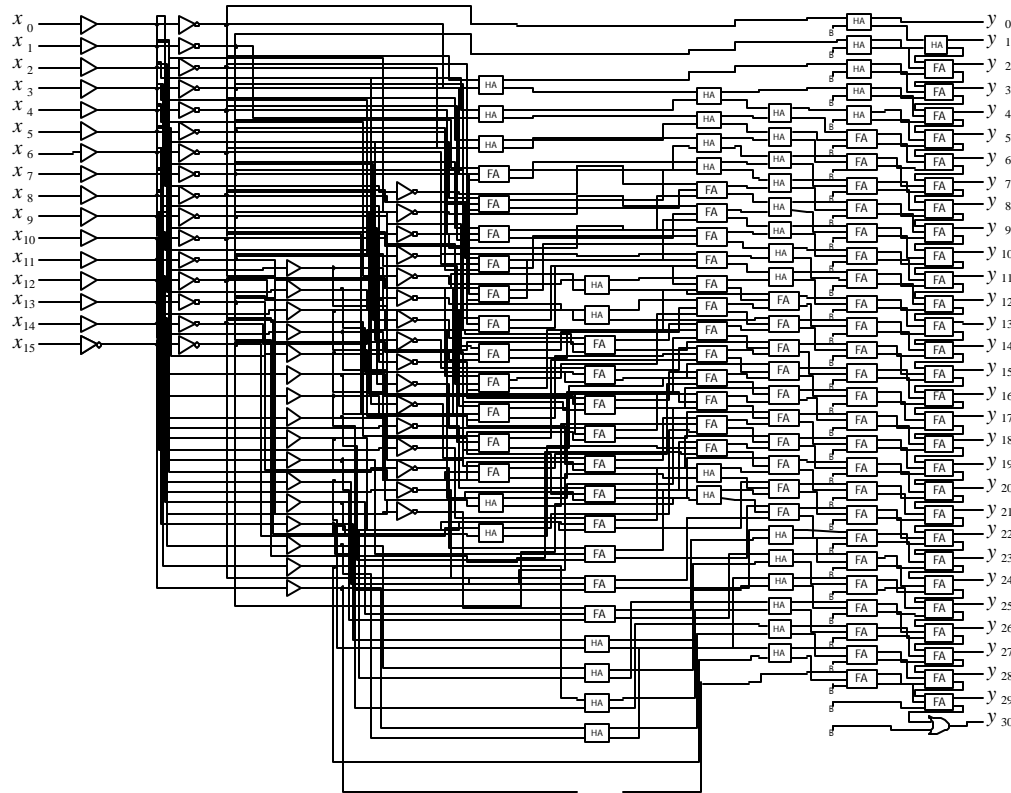

Evolutionary Graph Generation (EGG)

Key ideas of EGG

- To employ general graph structures as individuals
 - Search space reduction by graph theoretic constraints
 - Graph-based abstraction of arithmetic algorithms
- To introduce subgraph-based evolutionary operations
 - Hypothesis: every arithmetic circuit is a collection of many useful sub-circuits, and the total functionality of a circuit emerges from a collective behavior of its sub-circuits.

Constant-coefficient multiplier synthesis

Ex. $Y=10075X$ (16-bit precision)

Conventional best multiplier
(CSD encoding and Wallace tree)

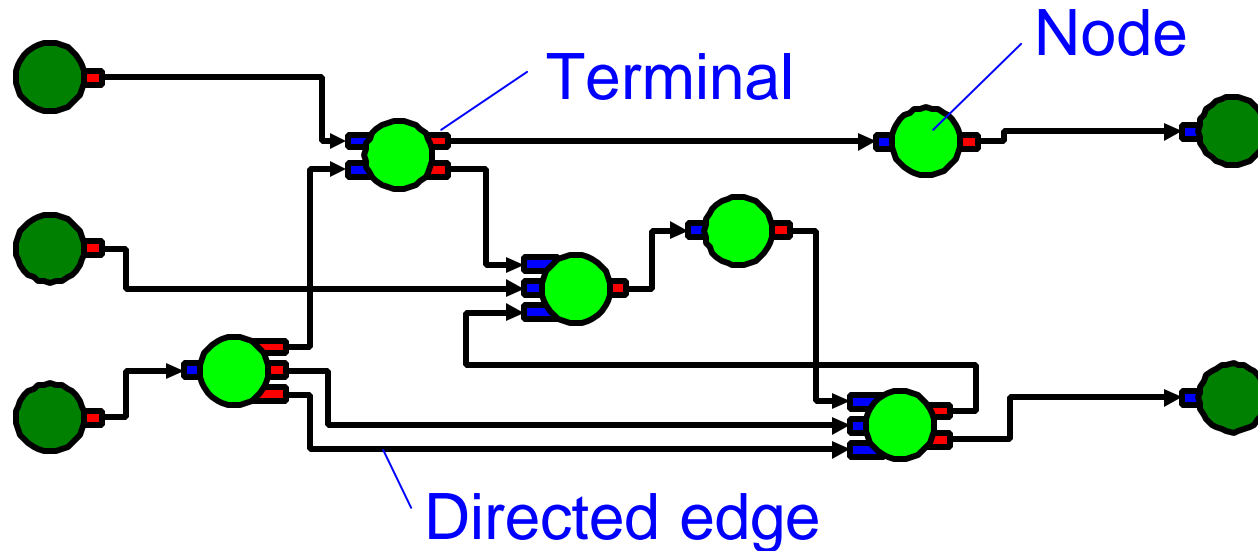

Solution generated
by the EGG system

Outline

- Backgrounds
- Basic concept of Evolutionary Graph Generation (EGG)
- System implementation for constant-coefficient multiplier synthesis
- Experimental result
- Conclusion and prospects

Graph-based individual representation

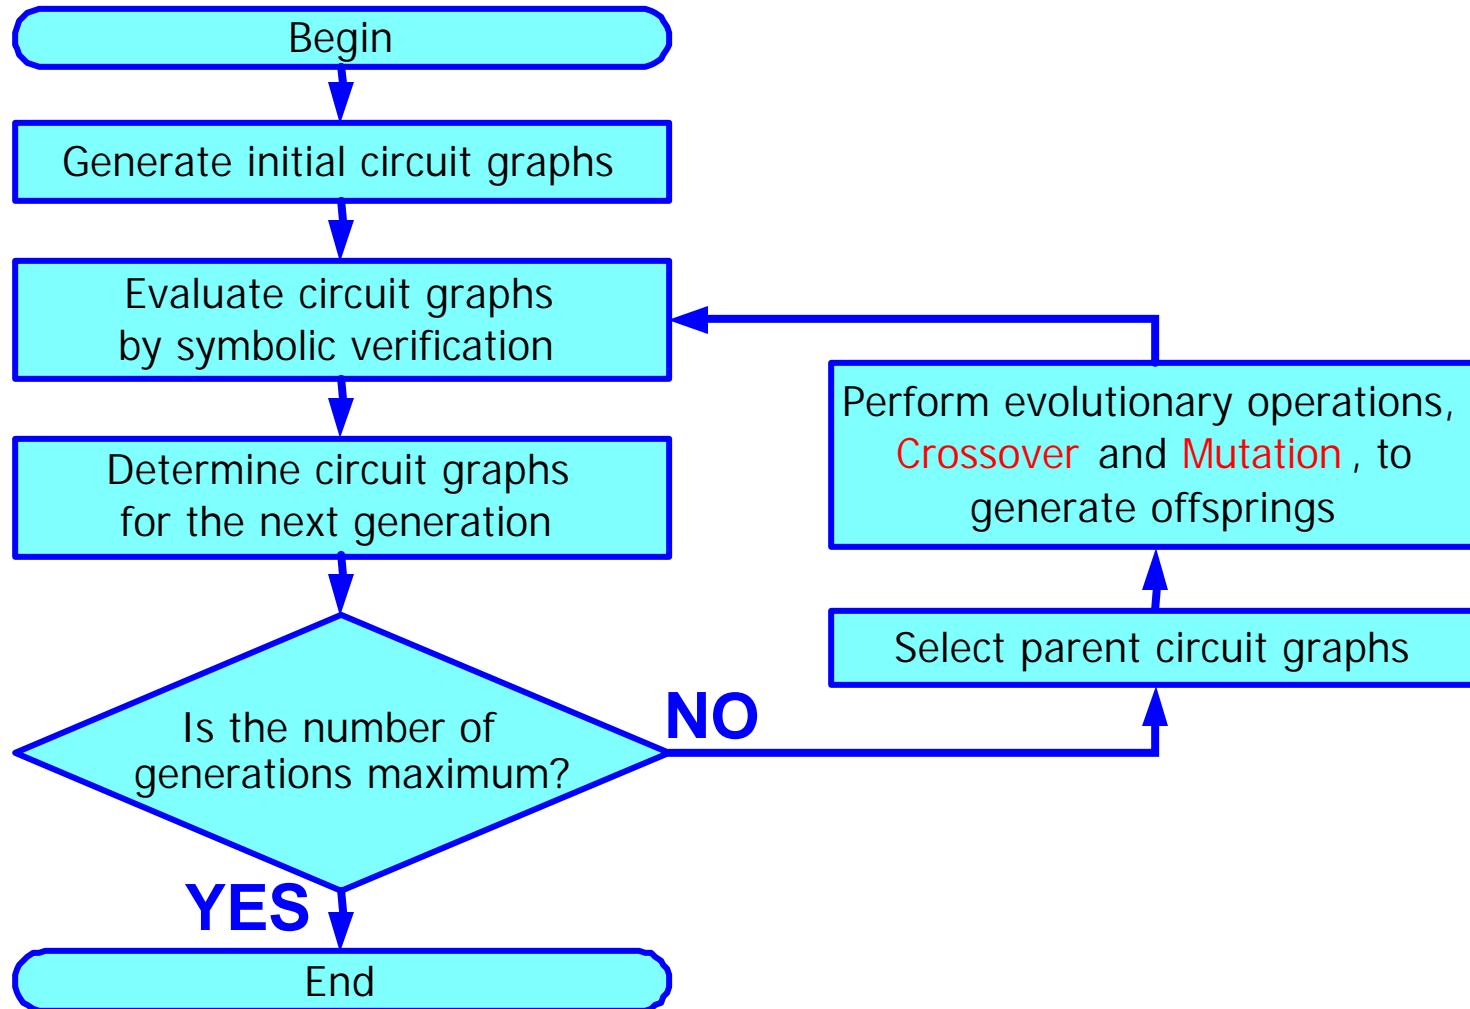

Circuit Graph $G = (N^G, T_O^G, T_I^G, \mathbf{n}_O^G, \mathbf{n}_I^G, \mathbf{e}^G)$

No unconnected terminal = **Complete circuit graph**

To guarantee valid circuit structures, the EGG system generates only complete circuit graphs.

EGG system flow

Evolutionary Operations

Crossover

Mutation

Constant-coefficient multiplication: $Y=RX$

Why constant-coefficient multipliers?

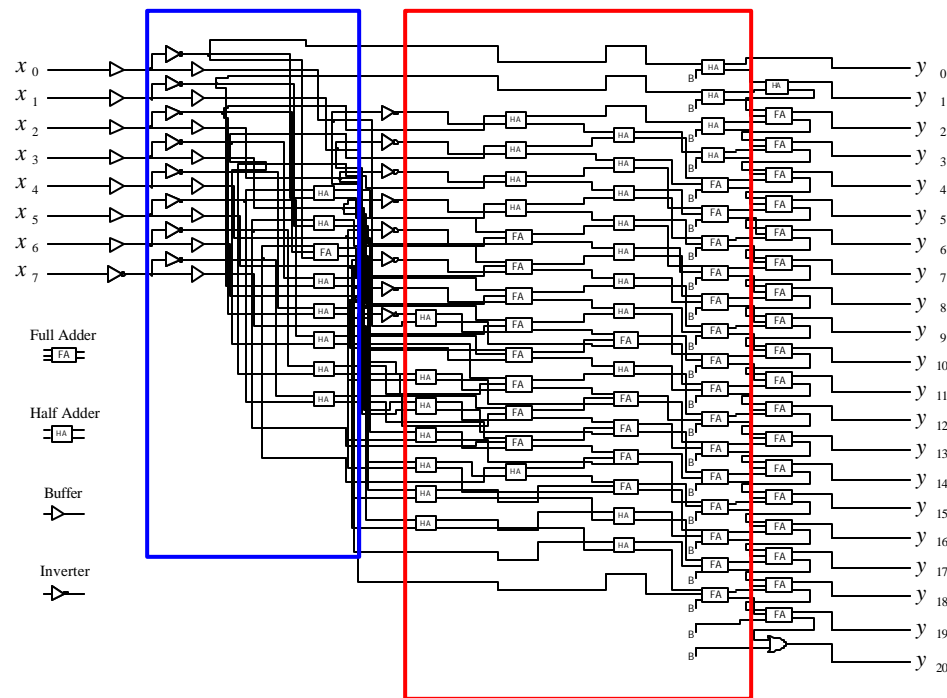

- There are many possible choices for the multiplier structure for a specific coefficient.
- The complexity of the multiplier structure significantly varies with the coefficient R .
- There is no systematic way of predicting the best structure even if we have the knowledge of fundamental arithmetic components.

Combinational constant-coefficient multipliers

- Partial product generation: **CSD encoding**

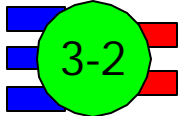

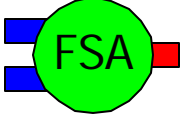

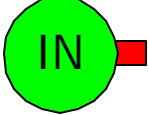

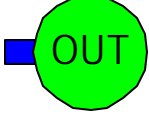

$$124_{10} = 01111011_2 = 10000\bar{1}00_{CSD}$$

- Partial product accumulation: **Wallace tree**

Design specification

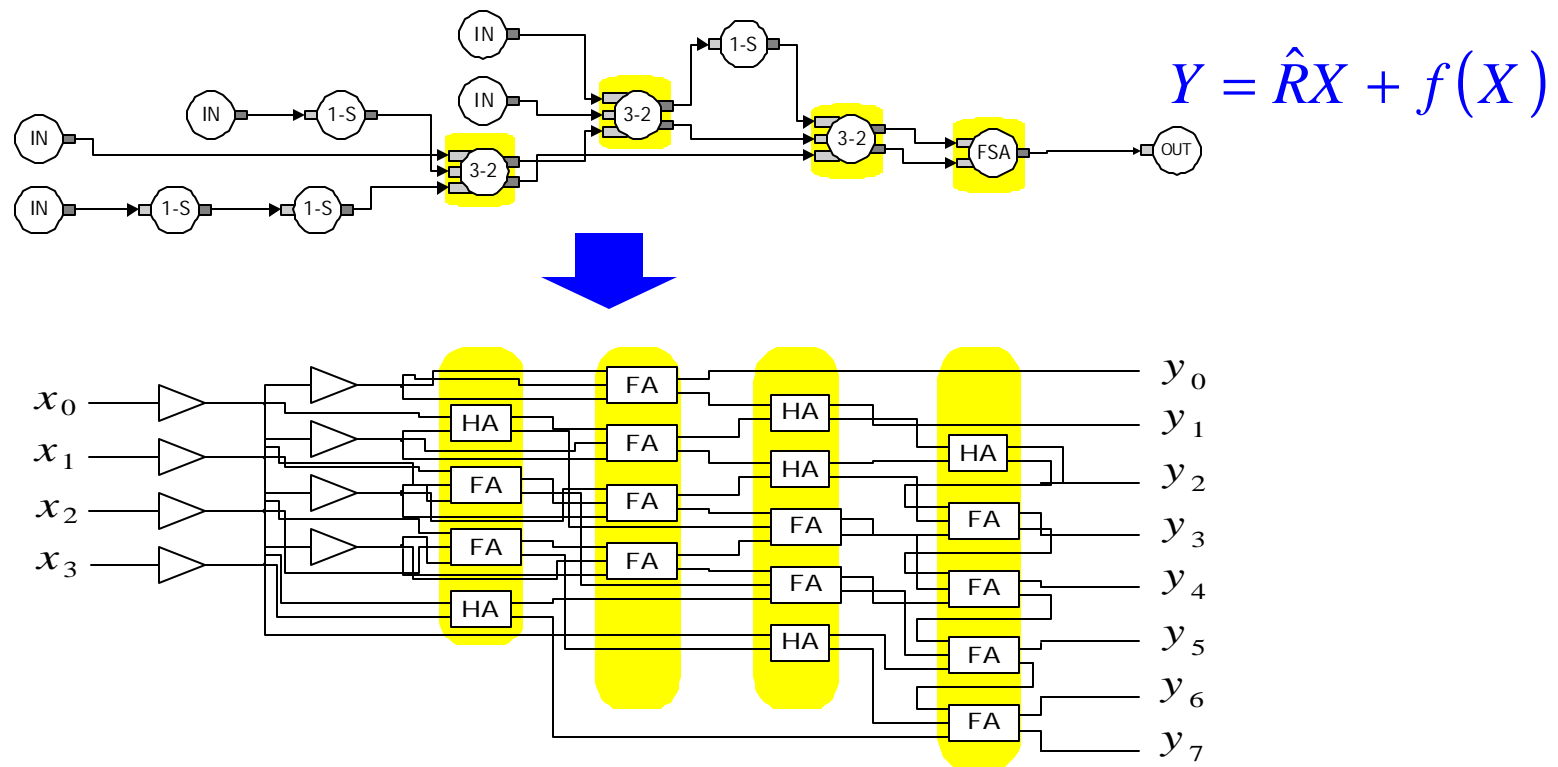

- Table of nodes used in the EGG system

Name	Symbol	Function
3-2 counter		3-input 2-output carry-free addition with output branches
N-bit shifter		N-bit arithmetic shifter (N:1,2,4)
Final-stage adder		Carry-propagate addition with a bias canceling stage
Operand input		Input signal
Operand output		Output signal

- FSA node is directly connected with OUT node.
- **Individuals: Circuit graphs without any feedback loops**

Individual circuit graph

Complete circuit graph without any feedback loops
(directed acyclic graphs)

Ex., 4-bit unsigned binary data

Evaluation

$$\textit{Fitness} = F + P \quad (P_{\max} / F_{\max} \cong 5/100).$$

Functionality measure (F)

Functionality measure evaluates validity of the logical function compared with the target coefficient.

\hat{R} : Coefficient obtained from circuit graph

↑ **Correlations**

R : Target coefficient

Performance measure (P)

$$P = \frac{C}{DA}$$

D : Number of counter stages

A : Number of inter-module interconnection

C : Constant adjusted to keep the ratio of P to F .

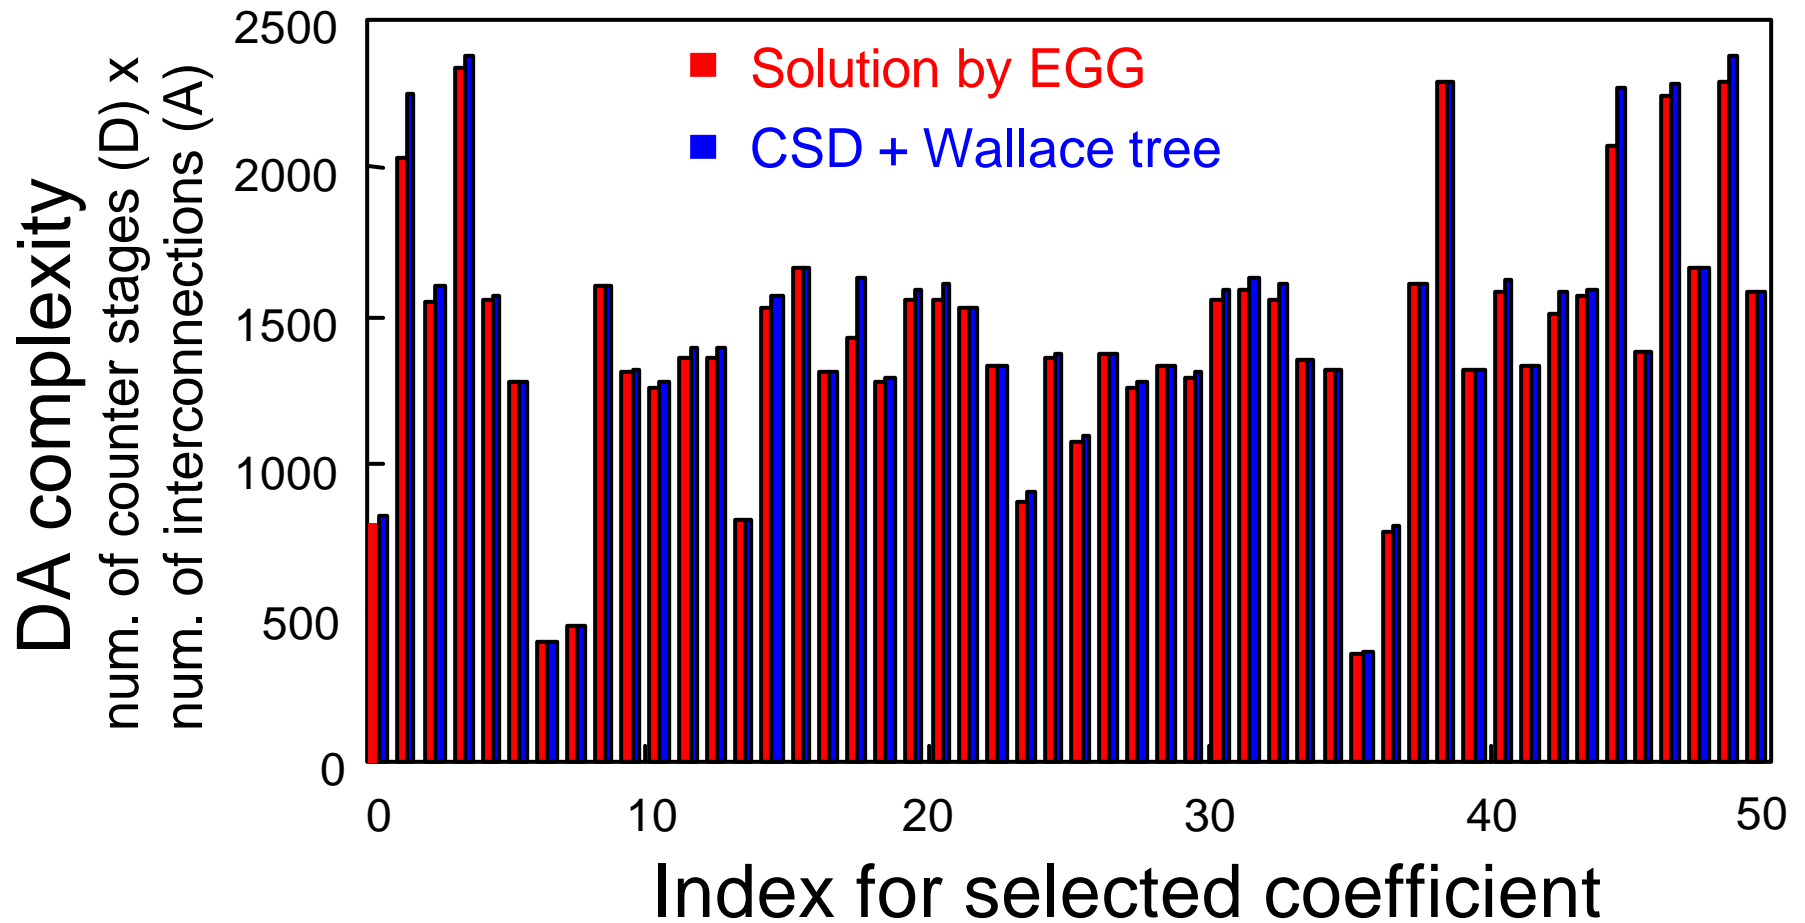

Experimental condition

- Generate 50 distinct multipliers whose coefficients are selected randomly in the range of -32768 to 32767.
- Compare the solutions generated by the EGG system and the corresponding CSD multipliers using Wallace tree architecture.

Main parameter values

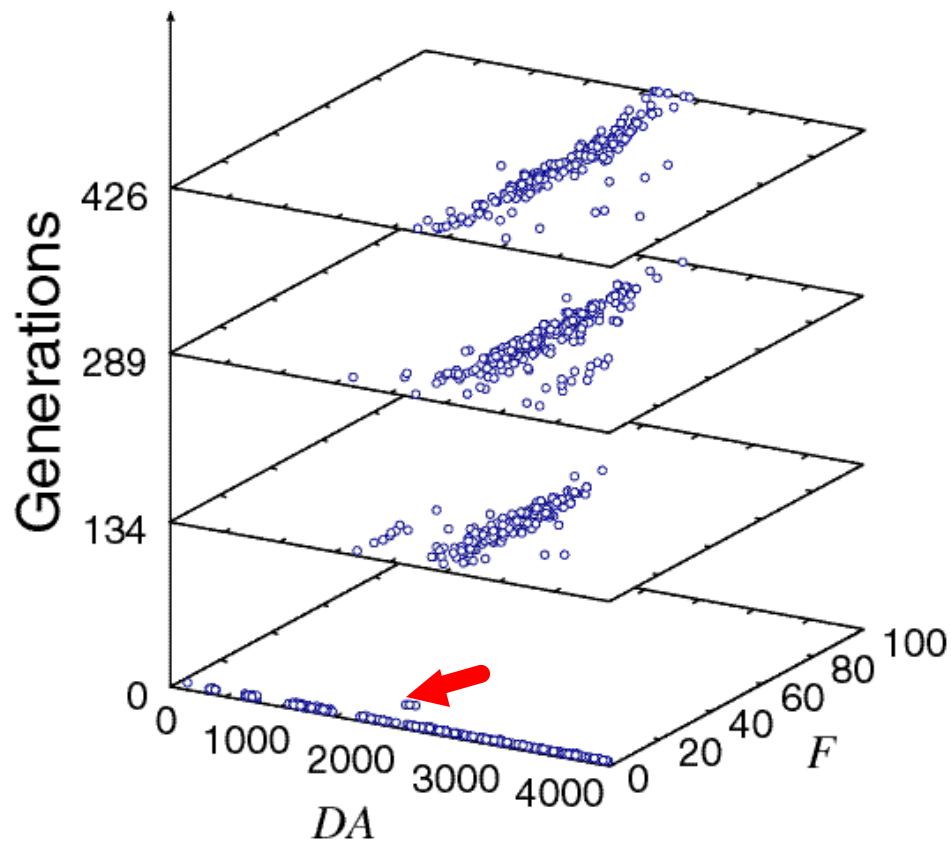

Population size	500	Crossover rate	0.7
Max. num. of generations	500	Mutation rate	0.2
Max. num. of nodes	50	Operand word-length	16

Experimental results

Example of evolution process

Ex. $Y=26204X$

$F = 17$ $DA = 1985$

Example of evolution process

Ex. $Y=26204X$

$F = 100$ $DA = 2345$

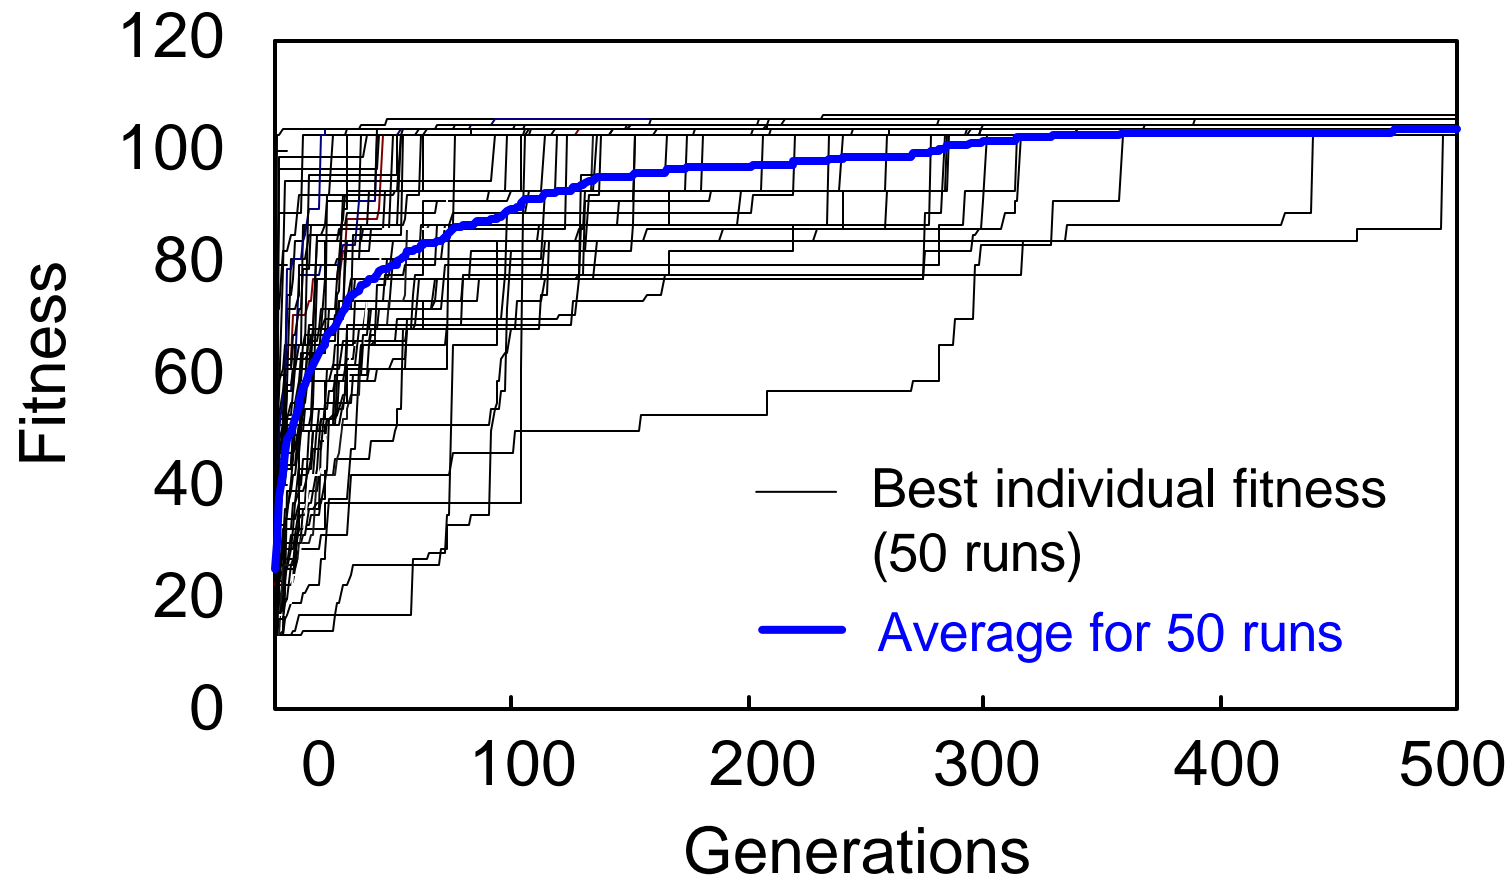

Example of evolution process

Ex. $Y=26204X$

$$F = 100 \quad DA = 2070$$

Transition of the best individual fitness

Average computation time required to obtain the solution is about 3.6 hours on a Linux PC with 700 MHz Pentium III.

Conclusion

Arithmetic circuit synthesis using Evolutionary Graph Generation (EGG)

Key ideas of EGG

- To employ general graph structures as individuals
- To introduce subgraph-based evolutionary operations

Ex., constant-coefficient multiplier synthesis

- All the solutions generated by the EGG system are comparable with the conventional best multipliers.

EGG framework

The image displays a collage of browser windows related to the EGG framework. The top-left window shows an introduction page with text: "example, we have created 6 new classes inheriting from *Graph*, *SubGraph*, *Node*, *Terminal*, *Fitness* and *Evaluation*, respectively. The EGG system can be systematically modified for different class templates." Below this text is a class hierarchy diagram (Figure 3. Class Hierarchy) showing a tree structure starting with POPULATION, branching into Control and Population, and further into various sub-classes like POPULATION1, POPULATION2, POPULATION3, POPULATION4, POPULATION5, POPULATION6, POPULATION7, POPULATION8, POPULATION9, POPULATION10, POPULATION11, POPULATION12, POPULATION13, POPULATION14, POPULATION15, POPULATION16, POPULATION17, POPULATION18, POPULATION19, POPULATION20, POPULATION21, POPULATION22, POPULATION23, POPULATION24, POPULATION25, POPULATION26, POPULATION27, POPULATION28, POPULATION29, POPULATION30, POPULATION31, POPULATION32, POPULATION33, POPULATION34, POPULATION35, POPULATION36, POPULATION37, POPULATION38, POPULATION39, POPULATION40, POPULATION41, POPULATION42, POPULATION43, POPULATION44, POPULATION45, POPULATION46, POPULATION47, POPULATION48, POPULATION49, POPULATION50, POPULATION51, POPULATION52, POPULATION53, POPULATION54, POPULATION55, POPULATION56, POPULATION57, POPULATION58, POPULATION59, POPULATION60, POPULATION61, POPULATION62, POPULATION63, POPULATION64, POPULATION65, POPULATION66, POPULATION67, POPULATION68, POPULATION69, POPULATION70, POPULATION71, POPULATION72, POPULATION73, POPULATION74, POPULATION75, POPULATION76, POPULATION77, POPULATION78, POPULATION79, POPULATION80, POPULATION81, POPULATION82, POPULATION83, POPULATION84, POPULATION85, POPULATION86, POPULATION87, POPULATION88, POPULATION89, POPULATION90, POPULATION91, POPULATION92, POPULATION93, POPULATION94, POPULATION95, POPULATION96, POPULATION97, POPULATION98, POPULATION99, POPULATION100. Below the diagram is the caption "Figure 3. Class Hierarchy" and the text "EGG applications".

The middle window shows the source code of the EGG framework, listing various header files and source files, including: EGGApplication.h, EGGMeasure.h, EGGACConstruct.h, EGGACConstruct.cpp, EGGAParser.h, EGGAScanner.h, EGGAScanner.cpp, EGGOptionAnalyzer.h, EGGOptionAnalyzer.cpp, EGGRandom.cpp, EGGRandom.h, EGGAbstractNode.h, EGGControl.h, EGGCrossover.h, EGGEliteSel.h, EGGEvaluation.h, EGGGraph.h, EGGList.h, EGGMutation.h, EGGNode.h, EGGPopulation.h, EGGProcessor.h, and EGGRouteSel.h.

The bottom-right window shows the main website for EGG (Evolutionary Graph Generation). The page title is "EGG (Evolutionary Graph Generation)". The text reads: "Evolutionary Graph Generation (EGG) is a unique variation of evolutionary computation techniques." Below this is the EGG logo and a list of links: Introduction, List of Papers, Technical Document, Download, FAQ (Under construction...), and Links (Under construction...). At the bottom, there is a link "Back to Higuchi Lab."
